

This course plays a long game

One season is real. The track is longer.

1

Year 1 • 2026–27

Run a real resale business: choose a ready-made product, source it, price it by data, sell it. The season quietly walks the conceptual first half of AP Statistics — real data, real consequences, no formula drills.

2

Year 2 • 2027–28

Design Pack with Love's own branded product — the students' design, real tooling, packaging, minimum orders — and run a second season on it. The statistical thinking deepens on a project the students now largely drive.

3

Year 3 + self-study

With two real seasons as the backbone, students finish the syllabus through guided self-study — or take AP Statistics at school — and sit the AP exam.

4

Grade 10 and up

Charter §5.9: members grow into High School Student Mentors — running the course themselves, with adults holding the guardrails.

AP readiness depends on each student's pace — the course builds the thinking; the exam prep on top is a manageable, guided step.

The AP Statistics track, year by year

Concepts first, on the class's own data; formulas and inference later. Unit numbers refer to the revised AP Statistics course (effective Fall 2026).

1

Year 1 • Resale season

Pose the question • sampling and bias • graphs and summaries • two-way tables • simulation and expected value. All 13 topics of Unit 1 and the descriptive half of Unit 2, at the concept level. No formulas, no inference.

2

Year 2 • Own product

Students now control the product, so the statistics grow with it: a real randomized experiment (1.13 in full), quality data from their own production (SD, outliers — 1.7–1.9), probability for defects and demand (2.5–2.9).

3

Year 3 • The exam

The remaining two-thirds — normal and sampling distributions (2.10–2.12), inference (Units 3–4), regression (Unit 5) — through guided self-study or AP Statistics at school, then the exam.

4

Two facts that help

The revised AP course requires only first-year algebra. And from Grade 10, Charter §5.9 lets members teach Year 1 to the next cohort as High School Student Mentors — the deepest way to learn it.

Two seasons of real data are the backbone; the exam preparation on top is a manageable, guided step whose timing depends on each student's pace.
